

**General Recommendation:**

- All of our providers agree that the COVID vaccine is safe and recommend it for our patients.
- The potential risk of complications from COVID far outweighs any potential risk of side effects from the vaccine.

**COVID Vaccine and Other Vaccinations:**

- You can get the COVID vaccine at any point before, after, or at the same time as other vaccines.

**COVID Vaccine and Current/Previous COVID Infection:**

- With current COVID infection, you can get the COVID vaccine as soon as you are cleared from your quarantine.
- With previous COVID infection, it is still recommended to get the COVID vaccine.

**Reactions Following the COVID Vaccine:**

- The most common reactions are pain at the injection site, fatigue, and headache.
- No cases of myocarditis were seen in the vaccine trials for children ages 5-11.
- Cases of myocarditis in adolescents following COVID vaccination are less common and less severe than complications from COVID infection.

**Infertility:**

- There is no evidence that the COVID vaccine causes infertility in any age group.
- There have been no cases of infertility attributable to any of the COVID vaccines.
